

Durational measurements on the Dutch prefix *ge-*

Using old data from Harald Baayen's `languageR` package

Felix Golcher and Alter Ego

It is said that your life flashes before your eyes just before you die.

That is true, it's called Life."

– Terry Pratchett, *The Last Continent*

Abstract: This paper is about Dutch prefixes. It uses an example data set from (Baayen 2008).

We tried to figure out if the frequency of a word has an influence on the duration of Dutch prefixes. Intuitively one could assume that with the duration drops with frequency. For this we recruited 130 Dutch native speakers. They produced 421 different words. Figure 1 gives an overview of the data. We clearly see a downward trajectory.

What shall we do?

Update your `Rmd` file so the output matches this document.

- Avoid very long lines by putting one sentence per line.
- Pay attention to line breaks and paragraph endings.
- Add a comment. You can complain about everything, no one will see it.

If you don't remember the syntax, the cheatsheet or google will surely help. If not, I'm there to help.
